

Over 300 pigeon species are recognized worldwide according to national geographic.
And if you would believe it pigeons actually do have the ability to retain their own shite.

12.8-P. drank entire milk jug cap full of urine. (mine!) Sits close to me the past 3 days. Seems to trust more. YES to piss. YES to Reeses creamer, YES to Functional Protein Bar. YES to Mocha Coffee.

The BIRD Notes

2025...

Pidgeotto died on the night of December 9th before we could bring him to a hotel room for a party...

The following is what we were able to document during the time of the two months between October and this mid-december to extend the range of lifespan of a bird which was already injured. It lived with the writer that time. A party ensued... it lasted 9 days until the bird died whilst placing that loathsome cherry on the last of the 10 day let off. Colder nights of many weeks prior P. survived and his erratic behavior the past two days could be explained only by self awareness, but perhaps it

was my body heat which kept him alive or gave him the reason. He perished for want of that reason. Or perhaps it was the inevitability of Time. Only one day and the nightmare the writer had on the 7th of P. walking away to join his other friends in the woods had been fulfilled. A fated parting. Supplies and tent be damned.

Be it of worthy note that bird shite arrived at the funnel end of our tent from above on and only the day P. arrived as if condolence for the rescue; a Pawn Sacrifice gone wrong. Was this mockery for the futility in it all? Enemies is Birddom?

Log
1.

Entry
point: Sidewalk.

An injury to the left wing prevents flight. Clasp and retrieve. Talk to bird while walking two miles through Tulsa traffic at night. on the way the writer is approached by a hobo who refers to the Pidgeotto as a yard bird, something worth eating in prison. Dont mind the neighborhood psychotic. Continually speaking.

Through the woods and passed a temporarily stagnant creek which would later be used as a birdbath water source; a third of a recovered red plexy cooler, sidewalk snipe. Bird half passed out as it were but recovered with wing shedding subsiding after two weeks.

To Feed a Pidgeon

10/12 P. had been rescued by a dumpster-7pm, Saturday.

10/13, Sunday - day two. pee continues to occupy corner of 10 farthest from me. Pidgeotto indeed prefers to sleep on the provided pad which serves as a bed: 12pm - 6pm. 3a. snack. P. stands all day, left wing fractured. Eats typically around 2pm. 3pm, lays down and eats a cheese curd. After SELF lays down. 3:25, circling the tent and pecking. Seeking alternative to curds. at 4pm Pidgeotto climbs on SELF and inspects for 10 minutes. (Trust Increase). P. returns 20 minutes later and remains perched.

10/14

6a. P conducts a food search through tent to commence my awareness of the day. I observe him with anticipation. An object of fancy having full awareness of the rarity for the occasion to capture, and live with this bird domestic. For the next two months I would work to extend this creatures lifespan and learn as much as am able.

As the sun goes down on 10.14 like others, sleeps after the crack end of Twilight meets the shades. Here in the underworld a pigeon sleeps because they are a dayurnal.

At 6:30 a.m. the following morning he moves over to his pad and starts eating cheese curds. odd sympathetic response to the writer eating old fries and proceeds to pad for bread. 4:00 p.m., Larger amounts of food and typically eat the most in the

afternoon with a 2:00 a.m. shite. an average of five to 10 shits a day. currently holds preference for shitting on my jeans. pigeon seems like fries.

10.15

pigeon rise is at 7:00 to 8:00 a.m. Sunday and sleeps at desk 8 to 9:00 p.m. as a routine. just cleaned between 5 to 8 turds cleaned up by now. feathers still falling out rapidly. Will reduce split water with omega-3 and curcumin extract. Though tired and broken down and passes out upon arrival when retrieved on the first day it seems to be displaying a heightened curiosity as of late.

increased trust though dodgy. continues to climb on self. Eats sunflower seed. water levels in Omega cup observed falling. 7p. Eats supplement powder After being broken out of pill capsule. at times prefers it to egg burrito.

10.17

Starts as always awake at the crack of dawn. today I decided to give p. an energy beverage. 7:35p fans wings perhaps in attempt to expand. Tried beverage. maybe beginning to regrow feathers. White growth pattern on back hidden beneath. feather loss dissipation. Day 4 or 5. More Sunflower seeds, 8p. at 8:15p the writer notices black goey types turds. Three in a span, perhaps a reaction to caffeine. Superbird consumes spilled energy beverage at 8:25 p.m. Also enjoys Stars and Stripes diet cola from the Dollar Tree. Many returns for it in one sitting. 3 times as much as energy beverage. Continuous on the cola, 5-10 minutes on it. Adjusts position aggressively to line himself with the cup used as a repository. Ignores the writers erratic movements: hair tying, shifting, packing herbs, smoking them. Pidgeotto is still consuming cola

after 15 whole minutes. Averse reaction to cannabis cloud, not a smoker. A solid 20 minutes has passed and significant reduction in the levels of cola contained in repository. .75 oz but possibly one or two. Can't fly into bed, 4 inches off ground level.

After 30 minutes Pidgeotto cuts himself off finally. 7:00 a.m. the following morning, Pidgeotto's first act after standing for 15 minutes is to take a long haul off of the cola with three watery shits at night on pad and one off.

massive amounts of watering, Black is turned on Matt at 10ish. A definite two oz have been consumed.

Shedding has reduced to minimum.

10.18

5:30 p.m., water turds persist. T and nuddybuddy tonight. 4 oz of diet cola consumed by noon to 4-ish. At 6:00 p.m. Twilight hour, p. is on pad resting. 7:00 p.m. up pruning. standing on edge of cardboard pad. 7:20 p.m., back to sleep mode, talons hidden.

10.19

No sey... on the Yerbe Mate...

9:00 a.m. to 10:00 a.m. yes on Lays chips before cinnamon granola bar.

10.20

No preference for Yerbe Mate.

10.22

Preference for dark caffeinated sodas. repeat Stars and Stripes experiment. (immediate response!); two long halls after the writer leaves the tent.

10.24

Yes to whole pizza slice.

10.25

Yes to pepperoni and yes to corn.

10.26

A chips and cola kind of bird...

10.30

Standing on one talon for extended period, the right one for 10 to 15 minutes. (New feature) [after doing extended research on this phenomenon it has been determined that Pidgeotto does this in order to conserve heat.]

P. tries to keep turd piles ordered or limited toward piles 2 to 3 by bed possibly sleep turds. scatter shite otherwise found throughout tent. (one leg again). 40°, with noticeable shivering.

(Cloudy)

Hobbling on one talon with the left one raised.

Brown chemical vomit material in cola mug with a harsh smell that compels the writer to near vomit himself. Too quantitative to be of GSC Pop-Tarts, like cola, distributed only the night before. Pop-Tarts untouched until day of incident, the vomit came first - possible milk and cola reaction? (Dark green shite, liquid but not runny).

The distinctive randomness of each of Pidgeotto's eye blinks is indicative of intelligence. Poop tarts... consumed at 2pm.

11.1

Standing on one leg again...

11.2

Milk only today. Ran out of chow for self as well, Shaking reduced. (10 degrees warmer). Shedding ceased.

11.3

Rarely shuts on bed material. One right talon again.

11.6

Beak appears a lighter color, possible illusion. Red spots under wing still. Hobbling. Red spots maybe cheese curds residue.

11.8

shivering, hobbling; tripped im own turd (faceplant). Three options; cheese swirls, chips, and rice from a nearby Asian joint. P. goes straight for the chips. (of course!) Regular cooing still not present, sounds like dying chicken.

11.12

Reduced limping.

11.17

Limping ceased

11.21

When skateboard is introduced into the controlled tent environment of which the writer sleeps with the bird, P. prefers to sleep on the deck of the board as it reminds him of concrete IMO.

It is difficult to ascertain what a pigeon will not eat vs. what they will. The term rat with wings simply refers to the wide variety of consumables by the bird. The following is a list of yes's and

no's.

YES:

*Ensure Protein Milk
bread butter crumbs
Pop-Tarts
chocolate milk
pepperoni
pork rinds
chips, sour cream and onion
cookies, chocolate
Functional™ protein bar
Coffee
Human piss
Swiss cheese
Cran Pineapple
Danish*

NO:

Yerbe Mate

If anything from this Treatise can be useful in how to feed a pigeon over the course of two months, though the reader may be dissatisfied with the length may further, and is welcome to elaborate upon the subject as a contributor.

As a post-script it should be noticed that the Rothchilds were able to communicate secret messages about the stock market in advance using carrier pigeons as has been recently discovered though not believed at the time. The conspiracy theorists would have it another way. It had been noted by the press at the time that this is how the Rothschilds were able to communicate information in advance without anybody's foreknowledge.
